# Arduino and DAC

Digital to Analog Converter (DAC)

Hans-Petter Halvorsen

# Table of Contents

- Introduction
- Arduino
- DAC
- MCP4911
- Arduino Examples

# Introduction

# DAC

- DAC – Digital to Analog Converter
- A DAC IC (Integrated Circuit) is used to convert from a Digital Signal to an Analog Signal
- Different terms used: DAC, D/A, D2A, D-to-A
- In this tutorial a MCP4911 IC will be used, but lots of similar ICs can be used

# Why DAC?

- **Arduino UNO** R3 has no Analog Output channels
- We can then use the **SPI** bus (or I2C bus) available on the Arduino together with a commercial DAC chip to create our own Analog Out signal
- In this Tutorial I will use a **MCP4911** DAC chip (but many other similar chips exists)

[Table of Contents](#)

# Arduino

- Arduino is an open-source electronics platform based on easy-to-use hardware and software.
- It's intended for anyone making interactive projects, from kids to grown-ups.
- You can connect different Sensors, like Temperature, etc.
- It is used a lots in Internet of Things projects
- Homepage:  
<https://www.arduino.cc>

# Arduino

- Arduino is a Microcontroller
- Arduino is an open-source platform with Input/Output Pins (Digital In/Out, Analog In and PWM)
- Price about \$20
- Arduino Starter Kit ~\$40-80  
with Cables, Wires, Resistors, Sensors, etc.

# Connect Arduino to your PC

# Arduino Software

Upload Code to Arduino Board

Save

Open Serial Monitor

Compile and Check  
if Code is OK

Open existing Code

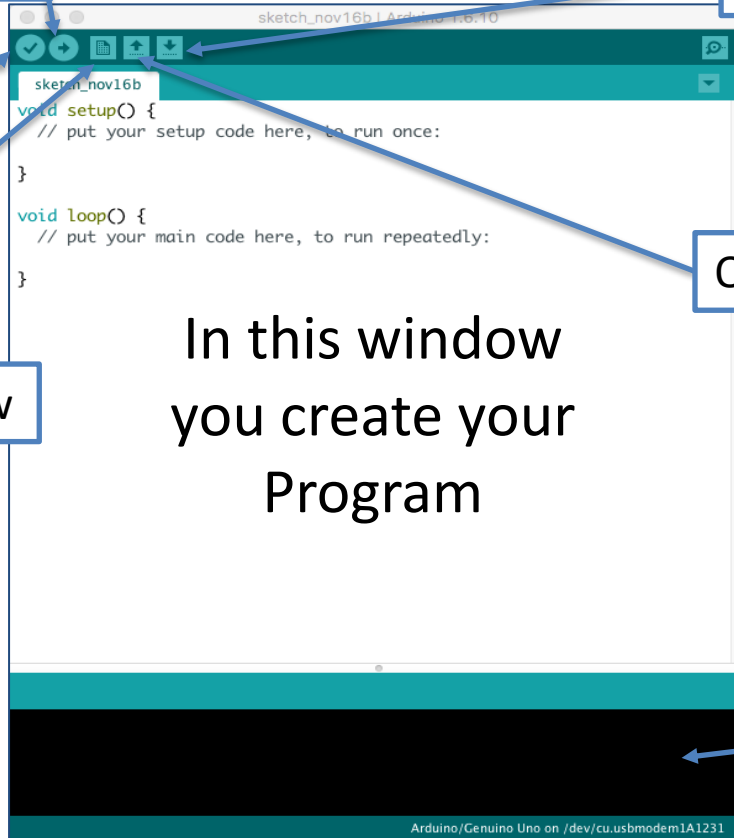

Creates a New Code Window

In this window  
you create your  
Program

The software can be  
downloaded for free:

[www.arduino.cc](http://www.arduino.cc)

Error Messages  
can be seen here

# Arduino Programs

All Arduino programs must follow the following main structure:

```
// Initialization, define variables, etc.  
  
void setup()  
{  
    // Initialization  
    ...  
}  
  
void loop()  
{  
    //Main Program  
    ...  
}
```

# DAC

Digital to Analog Converter (DAC)

# DAC

- Lots of different DAC ICs do exist
- IC – Integrated Circuit
- We will use **MCP4911** in this Tutorial

# MCP4911

Hans-Petter Halvorsen

[Table of Contents](#)

# MCP49xx

MCP49xx is a family of DAC Ics:

- MCP4901: 8-Bit Voltage Output DAC
- MCP4911: 10-Bit Voltage Output DAC
- MCP4921: 12-Bit Voltage Output DAC

The different MCP49xx DACs work in the same manner, the only difference is the resolution (8, 10, or 12 resolution)

# MCP4911

## 10-Bit Single Output DAC with SPI

- 10-bit resolution ( $2^{10}=1024$ )
- It comes in many packages, the one used in this tutorial is a breadboard-friendly version (8-pin DIP/DIL IC)

<https://www.microchip.com/en-us/product/MCP4911>

# SPI

- Serial Peripheral Interface (SPI)
- SPI is a synchronous serial data protocol used by microcontrollers for communicating with one or more peripheral devices quickly over short distances.

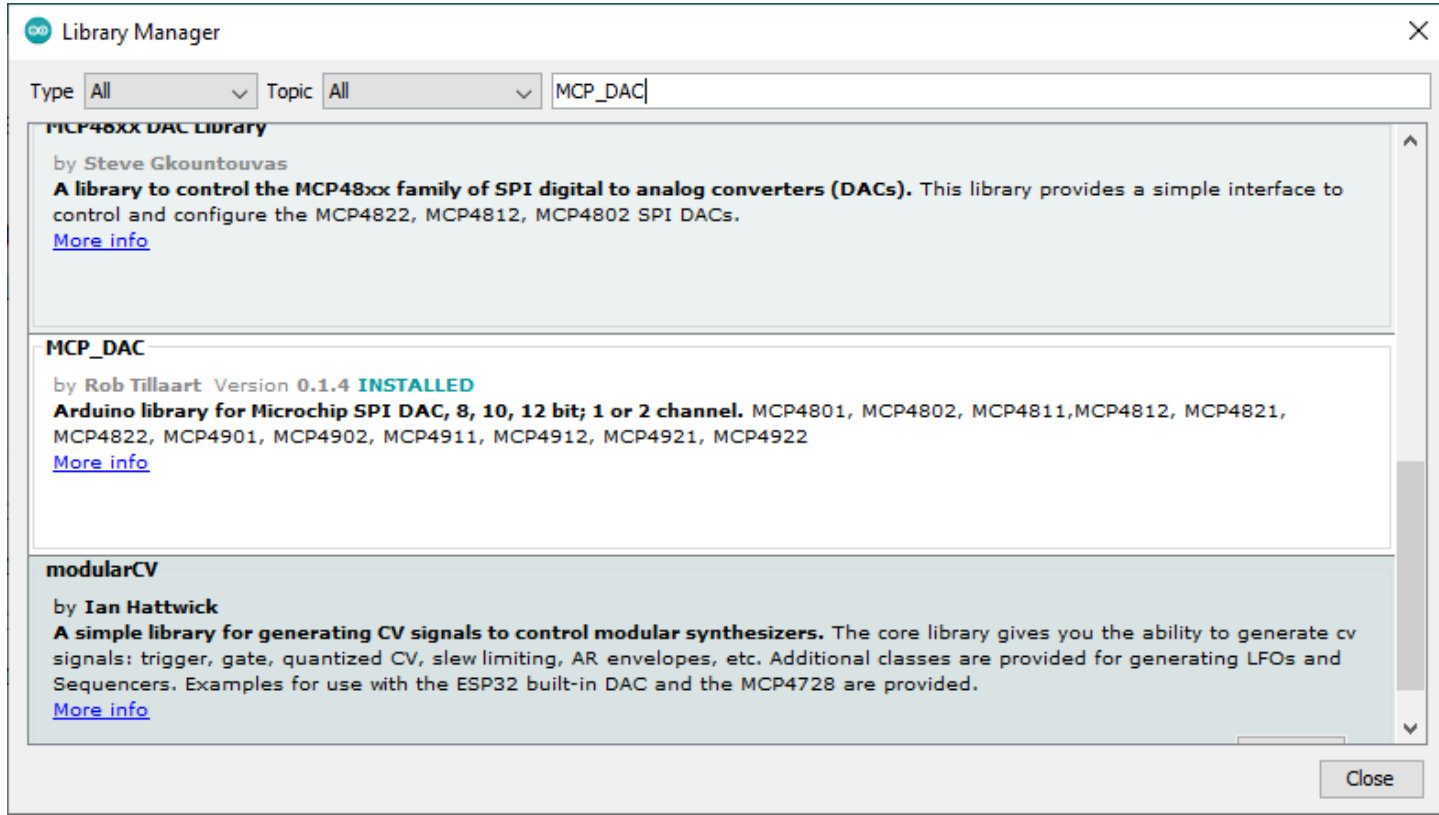

# MCP49xx Libraries

- Different Arduino Libraries for the MCP49xx family exists
- In this tutorial the “**MCP\_DAC**” library will be used.
- To use this library, open the **Library Manager** in the Arduino IDE and install it from there.
- [https://www.arduino.cc/reference/en/libraries/mcp\\_dac/](https://www.arduino.cc/reference/en/libraries/mcp_dac/)

# Install the MCP\_DAC Library

Tools -> Manage Libraries...

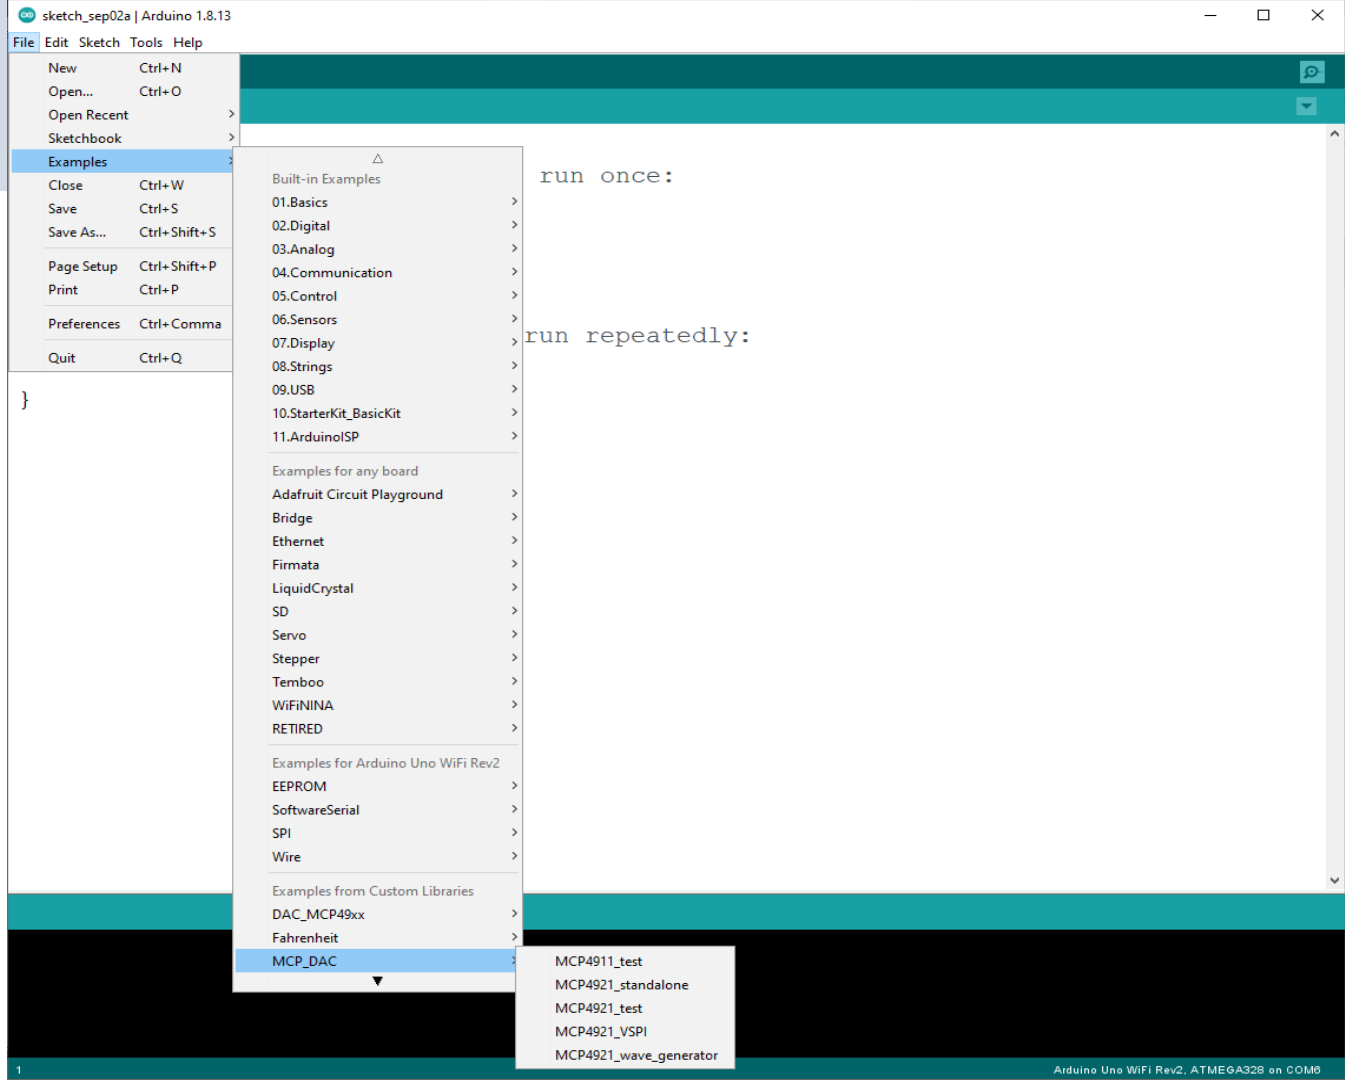

The screenshot shows the 'Library Manager' window in the Arduino IDE. At the top, there are dropdown menus for 'Type' (set to 'All') and 'Topic' (set to 'All'), followed by a search input field containing 'MCP\_DAC'. Below the search bar, three library entries are listed:

- MCP48XX DAC LIBRARY**  
by Steve Gkountouvas  
A library to control the MCP48xx family of SPI digital to analog converters (DACs). This library provides a simple interface to control and configure the MCP4822, MCP4812, MCP4802 SPI DACs.  
[More info](#)
- MCP\_DAC**  
by Rob Tillaart Version 0.1.4 **INSTALLED**  
Arduino library for Microchip SPI DAC, 8, 10, 12 bit; 1 or 2 channel. MCP4801, MCP4802, MCP4811, MCP4812, MCP4821, MCP4822, MCP4901, MCP4902, MCP4911, MCP4912, MCP4921, MCP4922  
[More info](#)
- modularCV**  
by Ian Hattwick  
A simple library for generating CV signals to control modular synthesizers. The core library gives you the ability to generate cv signals: trigger, gate, quantized CV, slew limiting, AR envelopes, etc. Additional classes are provided for generating LFOs and Sequencers. Examples for use with the ESP32 built-in DAC and the MCP4728 are provided.  
[More info](#)

A 'Close' button is located at the bottom right of the window.

# Examples

# Examples

We can use the  
“MCP4911\_test” Example as a  
starting point for our  
application.

```
MCP4911_test | Arduino 1.8.13
File Edit Sketch Tools Help

MCP4911_test

#include "MCP_DAC.h"

// MCP4911 MCP(11, 13); // SW SPI
MCP4911 MCP; // HW SPI

volatile int x;
uint32_t start, stop;

void setup()
{
  Serial.begin(115200);
  Serial.println(__FILE__);

  Serial.print("SPI:\t");
  Serial.println(MCP.usesHWSPI());

  MCP.begin(10);

  Serial.print("SPI:\t");
  Serial.println(MCP.usesHWSPI());
}
```

7 Arduino Uno WiFi Rev2, ATMEGA328 on COM6

# Examples

# Hardware Wiring

The MCP4911 is placed on a Breadboard and then wired to the proper pins on the Arduino UNO

# Hardware Wiring

# Arduino Example

Use a Multimeter and observe the Analog Output Value

**Note!** The “analogWrite()” function has been renamed to just “write()”.

```
#include "MCP_DAC.h"
```

```
MCP4911 MCP(11, 13);  
uint16_t value = 0;
```

```
void setup()
```

```
{  
    MCP.begin(10);  
    delay(100);  
}
```

```
void loop()
```

```
{  
    value = 0;  
    MCP.write(value, 0);  
    delay(5000);
```

```
    value = 512;  
    MCP.write(value, 0);  
    delay(5000);
```

```
}
```

# Example #2

Here a separate function is created and used.

Use a Multimeter and observe the Analog Output Value

```
#include "MCP_DAC.h"

MCP4911 MCP(11, 13);
uint16_t value = 0;

void setup()
{
    MCP.begin(10);
    delay(100);
}

void loop()
{
    WriteDAC(0);
    WriteDAC(128);
    WriteDAC(255);
    WriteDAC(512);
    WriteDAC(1023);
}

void WriteDAC(uint16_t value)
{
    MCP.write(value, 0);
    delay(5000);
}
```

# Example #2b

Here a separate function is created and used.

In addition, a For Loop has been used.

Use a Multimeter and observe the Analog Output Value.

```
#include "MCP_DAC.h"

MCP4911 MCP(11, 13);
uint16_t value = 0;

void setup()
{
    MCP.begin(10);
    delay(100);
}

void loop()
{
    for (int i=0; i<1024; i=i+50)
    {
        WriteDAC(i);
        delay(100);
    }
}

void WriteDAC(uint16_t value){
    MCP.write(value, 0);
    delay(5000);
}
```

# Example #3

In this Example the Values are also written to the **Serial Monitor**.

```
#include "MCP_DAC.h"
MCP4911 MCP(11, 13);

void setup()
{
  Serial.begin(9600);
  MCP.begin(10);
  delay(100);
}

void loop()
{
  WriteDAC(0);
  WriteDAC(1);
  WriteDAC(2);
  WriteDAC(3);
  WriteDAC(4);
  WriteDAC(5);
}
```

```
void WriteDAC(float voltValue)
{
  uint16_t adcValue;
  adcValue = (voltValue*1023)/5;
  if (adcValue < 0)
  {
    adcValue = 0;
  }
  if (adcValue > 1023)
  {
    adcValue = 1023;
  }
  Serial.print("V=");
  Serial.print(voltValue);
  Serial.print(", ADC=");
  Serial.println(adcValue);
  MCP.write(adcValue, 0);
  delay(5000);
}
```

# Summary

- Arduino UNO R3 has no Analog Output pins, only Analog Input pins and Digital Input/Output pins
- Now you have learned how you can extend the Arduino UNO R3 with Analog Output
- Good Luck with your Arduino Projects
