Measurement Studio

Hans-Petter Halvorsen

Measurement Studio

- Measurement Studio is an add-on to Visual Studio
 - This means you cannot use Measurement Studio without Visual Studio
 - Measurement Studio contains a set of Class Libraries and some Wizards/Templates for creating Applications using these features
- It supports some of the functionality to Visual Studio/C# users that exist in LabVIEW
- Measurement Studio is developed by National Instruments
- Visual Studio is developed by Microsoft

Measurement Studio

Measurement Studio is an integrated suite of tools and class libraries designed to help developers create measurement and automation Windows Forms, Windows Presentation Foundation (WPF), and Web Forms applications using Microsoft .NET technologies.

Measurement Studio - Class Libraries

Measurement Studio Visual C# Windows Application Wizard

Measurement Studio Class Libraries

Select the class libraries you want to include in the project.

Measurement Studio

- Measurement Studio 2015
 - For older version of Visual Studio
 - Can be used in Visual Studio 2019 with some modifications
 - You use “**DataSocket**” functionality to communicate with an OPC Server
- **Measurement Studio 2019**
 - Supports the new Visual Studio 2019
 - They have changed the way you communicate with an OPC Server.
 - The “DataSocket” functionality has been removed!!!
 - You now need to use the “**NetworkVariable**” functionality

Software

- Visual Studio 2019
- Measurement Studio 2019
- LabVIEW DSC Module 2019
 - In order to communicate with an OPC Server using Measurement Studio 2019 you also need the LabVIEW DSC Module (or just the LabVIEW DSC Module Run-Time System).

LabVIEW DSC Module

- LabVIEW DSC Module is an additional module for LabVIEW
- DSC – Datalogging and Supervisory Control
- Exchanging data between Measurement Studio applications and OPC servers requires LabVIEW DSC (LabVIEW DSC Module Run-Time System)

Distributed System Manager

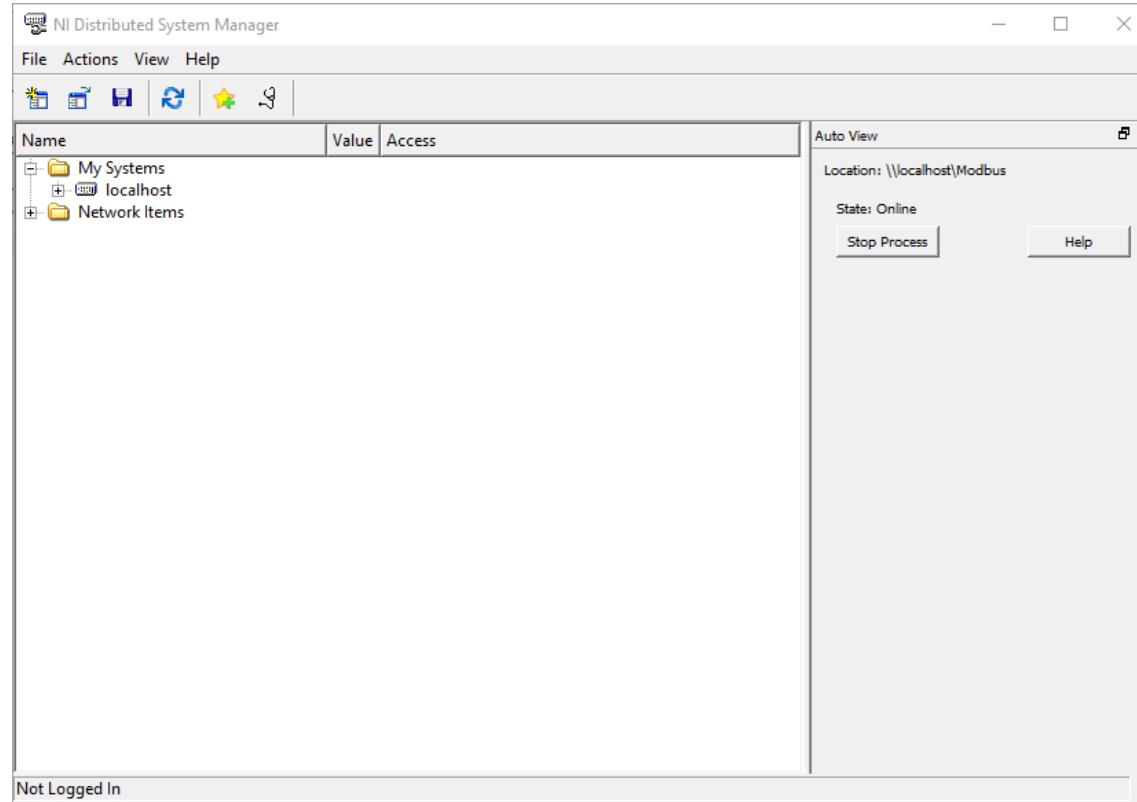

Hans-Petter Halvorsen

OPC with NetworkVariable

The following paragraphs explain how to use NetworkVariable with an OPC server using the LabVIEW DSC Run-Time System.

1. **Install LabVIEW Datalogging and Supervisory Control (DSC) Run-Time System.**
2. **Install your OPC server.** Only OPC2 and higher are supported by LabVIEW DSC Run-Time System.
3. Select Start»All Programs»National Instruments»**Distributed System Manager** to launch the application.
4. Right-click localhost and select **Add Process** to create a new process. Type Test_Process in the Add Process dialog box and click OK. Grouping variables by process allows you to organize your variables. You can start and stop processes independently, which allows you to easily manage your variables.
5. Right-click on Test_Process and select **Add I/O Server**.
6. For the I/O Server Type, **select OPC Client** and click Continue.
7. Type Test_OPc in the **Enter IO Server Name** dialog box and click OK.
8. **Select the OPC server** that you want to access through the Network Variable API from the list of Registered OPC Servers you installed in step 3 and click OK.
9. Right-click on Test_Process and select **Add Variable** to launch the **Shared Variable Properties** dialog box.
10. In the Shared Variable Properties dialog box, select the **Enable Aliasing** checkbox and click the Browse button.
11. In the Browse for Variable dialog box, select one of the OPC items from the OPC I/O server you configured in step 6.
12. Click OK to **bind the new variable to the OPC source**.
13. Click OK to return to NI Distributed System Manager. Use the new variable as you would any other shared variable. You can access the variable you have configured through the .NET **NetworkVariable class library**, as you would any other network variable.

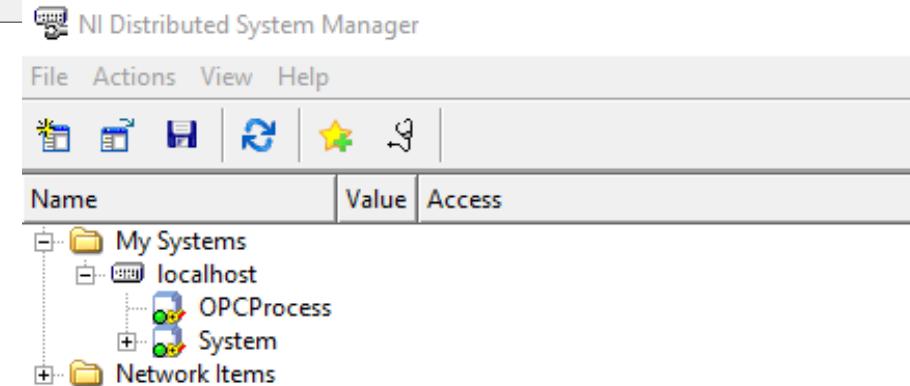

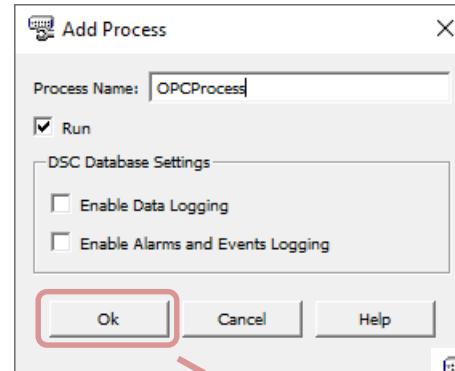

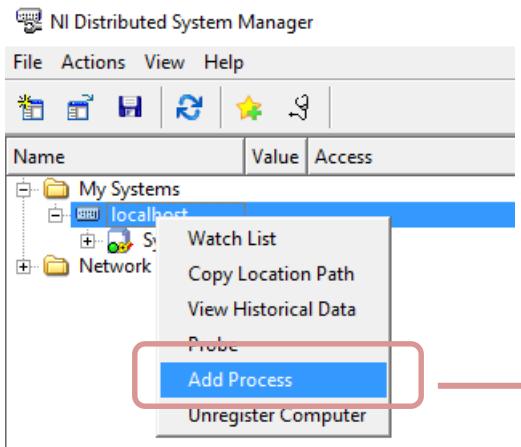

Distributed System Manager

Add Process

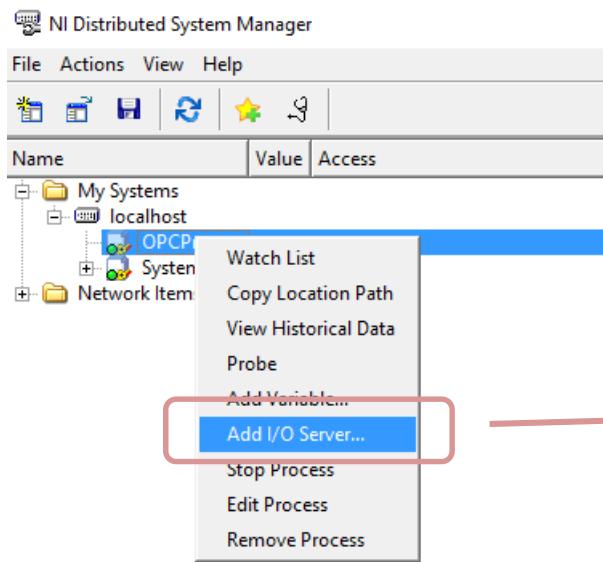

- Right-click localhost and select **Add Process** to create a new process.
- Type, e.g., “OPCProcess” in the Add Process dialog box and click OK.
- Grouping variables by process allows you to organize your variables.
- You can start and stop processes independently, which allows you to easily manage your variables.

Add Process

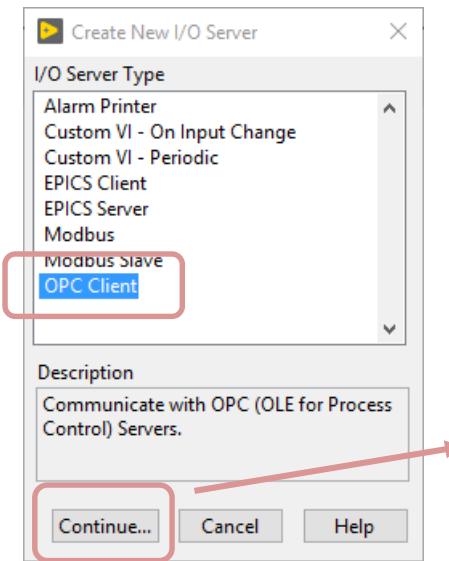

Add I/O Server

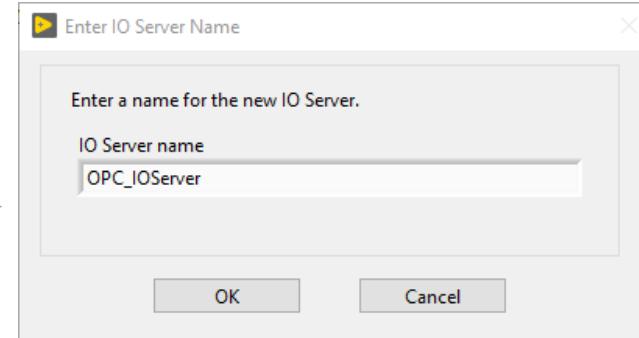

Right-click on “OPCProcess” and select **Add I/O Server**.

For the I/O Server Type, select **OPC Client** and click Continue.

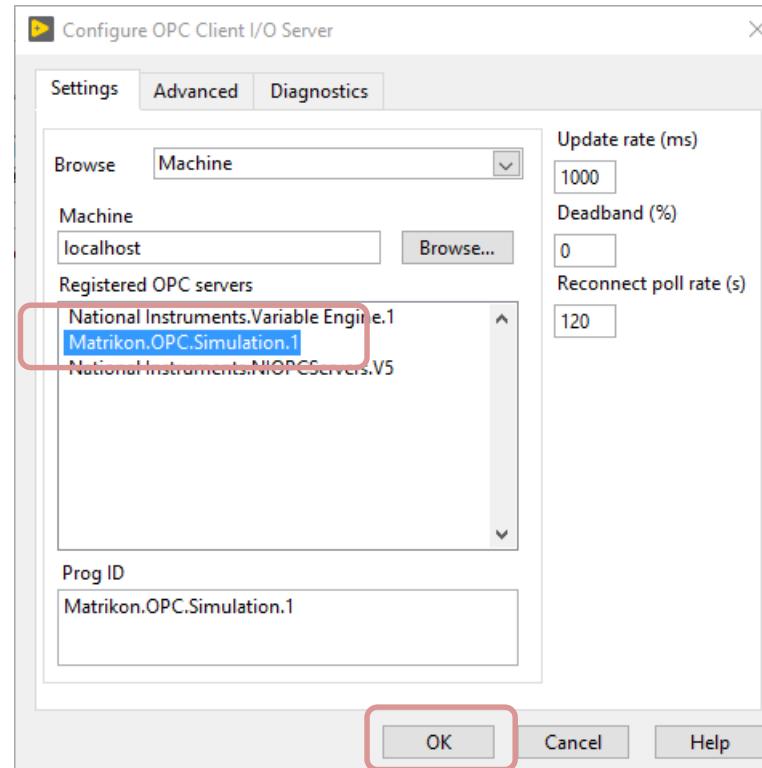

Type, e.g., “OPC_IOServer” in the **Enter IO Server Name** dialog box and click OK.

Select OPC Server

Select the OPC server that you want to access through the Network Variable API from the list of Registered OPC Servers and click OK.

Add Variable

- Right-click on “OPCProcess” and select **Add Variable** to launch the **Shared Variable Properties** dialog box.
- In the Shared Variable Properties dialog box, select the **Enable Aliasing** checkbox and click the Browse button.
- In the Browse for Variable dialog box, select one of the OPC items from the OPC I/O server you configured in step 6.
- Click OK to **bind the new variable to the OPC source**.

Add Variable

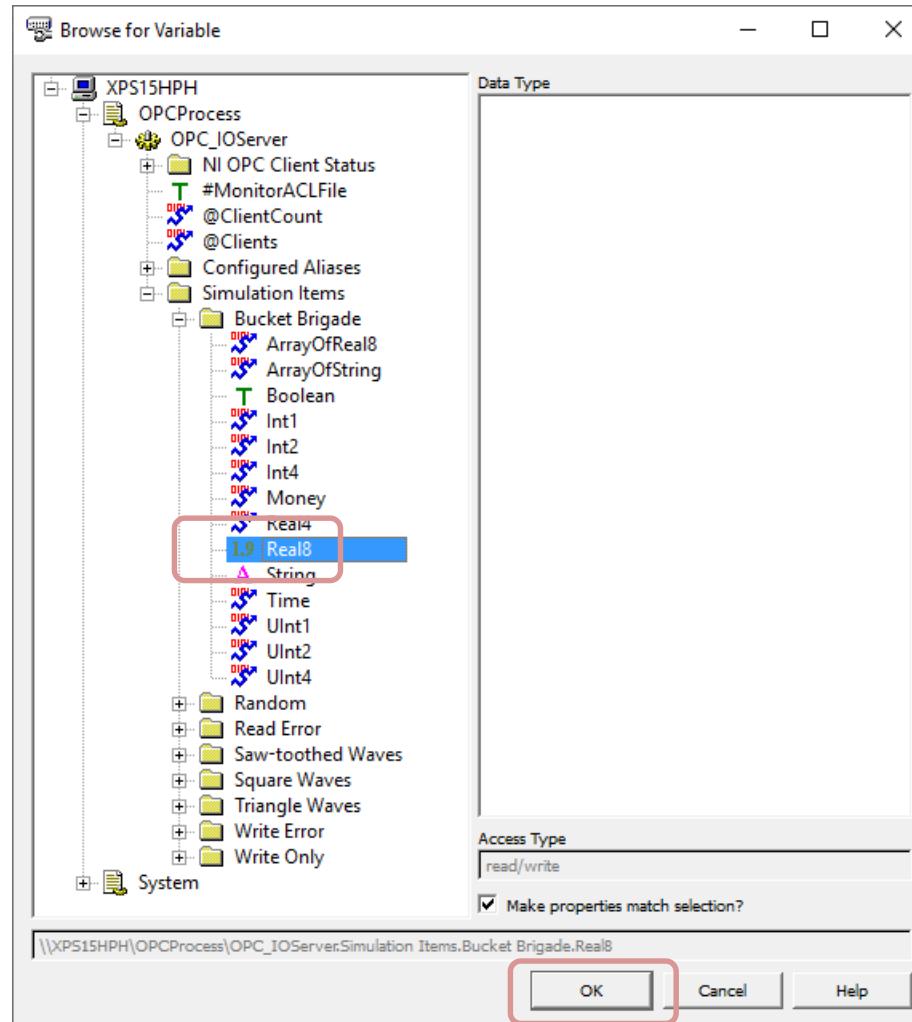

Right-click on “OPCProcess” and select **Add Variable** to launch the **Shared Variable Properties** dialog box.

Browse for Variable dialog box

In the Browse for Variable dialog box, select one of the OPC items from the OPC I/O server.

Click OK to bind the new variable to the OPC source.

Visual Studio

Hans-Petter Halvorsen

OPC in Visual Studio

We need to use the **NetworkVariable.dll** assembly which is part of the Measurement Studio Package

NationalInstruments.NetworkVariable.dll

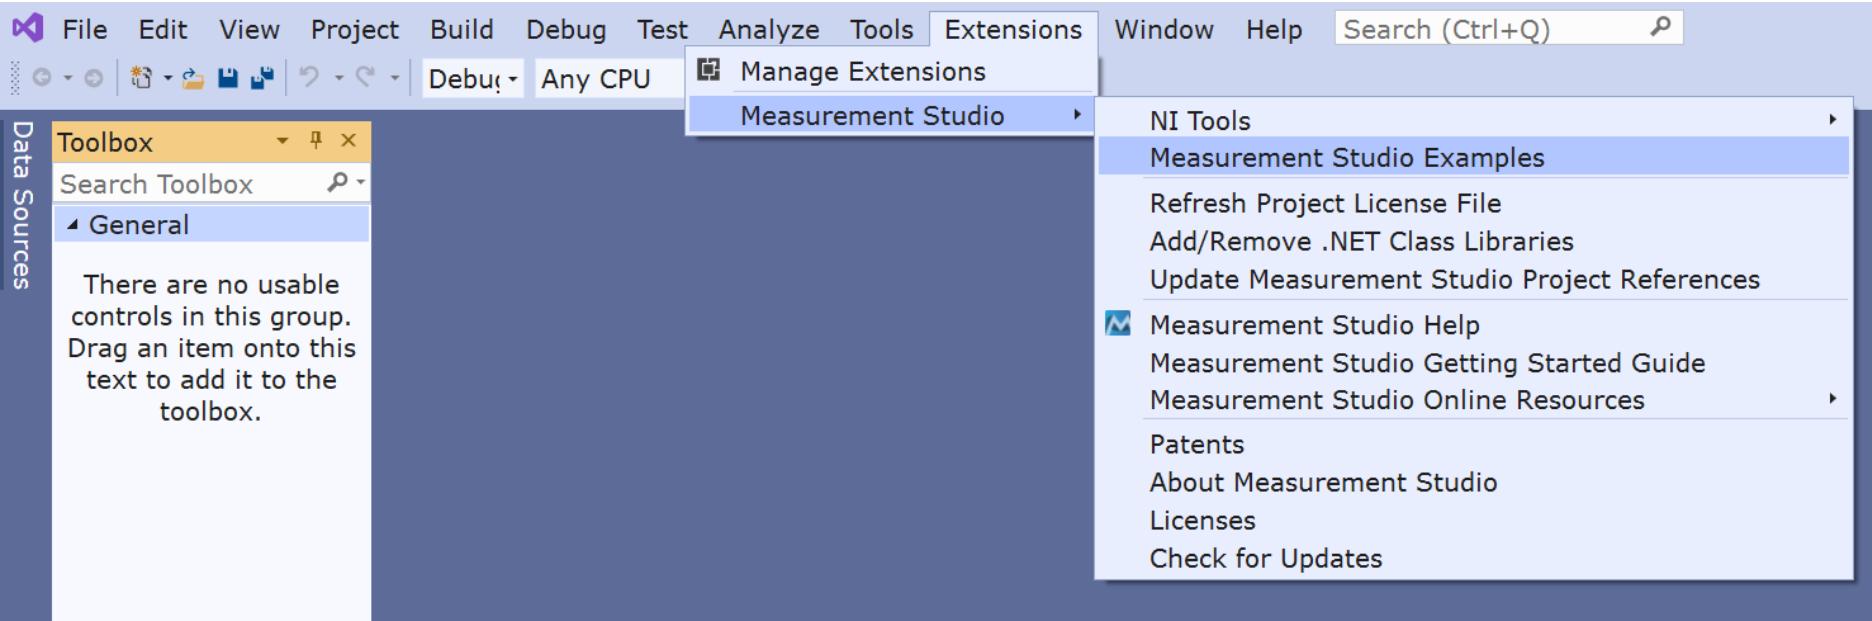

Path:

C:\Program Files (x86)\National Instruments\Measurement Studio\DotNET\v4.5\AnyCPU\NationalInstruments.NetworkVariable 19.0.45\NationalInstruments.NetworkVariable.dll

Description:

Contains classes to publish and subscribe to live measurement data over the Internet. Provides better scalability and higher performance than DataSocket.

Measurement Studio in Visual Studio

OPC in Visual Studio

2 Alternatives

- Alt1: You can use the Measurement Studio Template
- Alt 2: You can use the default Visual Studio Template for creating a C# Win Form Application
 - You need to add the necessary Assemblies manually (“Add Reference” in Visual Studio)
 - You need to add License Information manually (“licenses.licx” in Properties folder)
